# Lab 8: Table Operations

This lab has one small practice exercise and then 3 maps you will make. The last two will be on the SAME page (PDF).

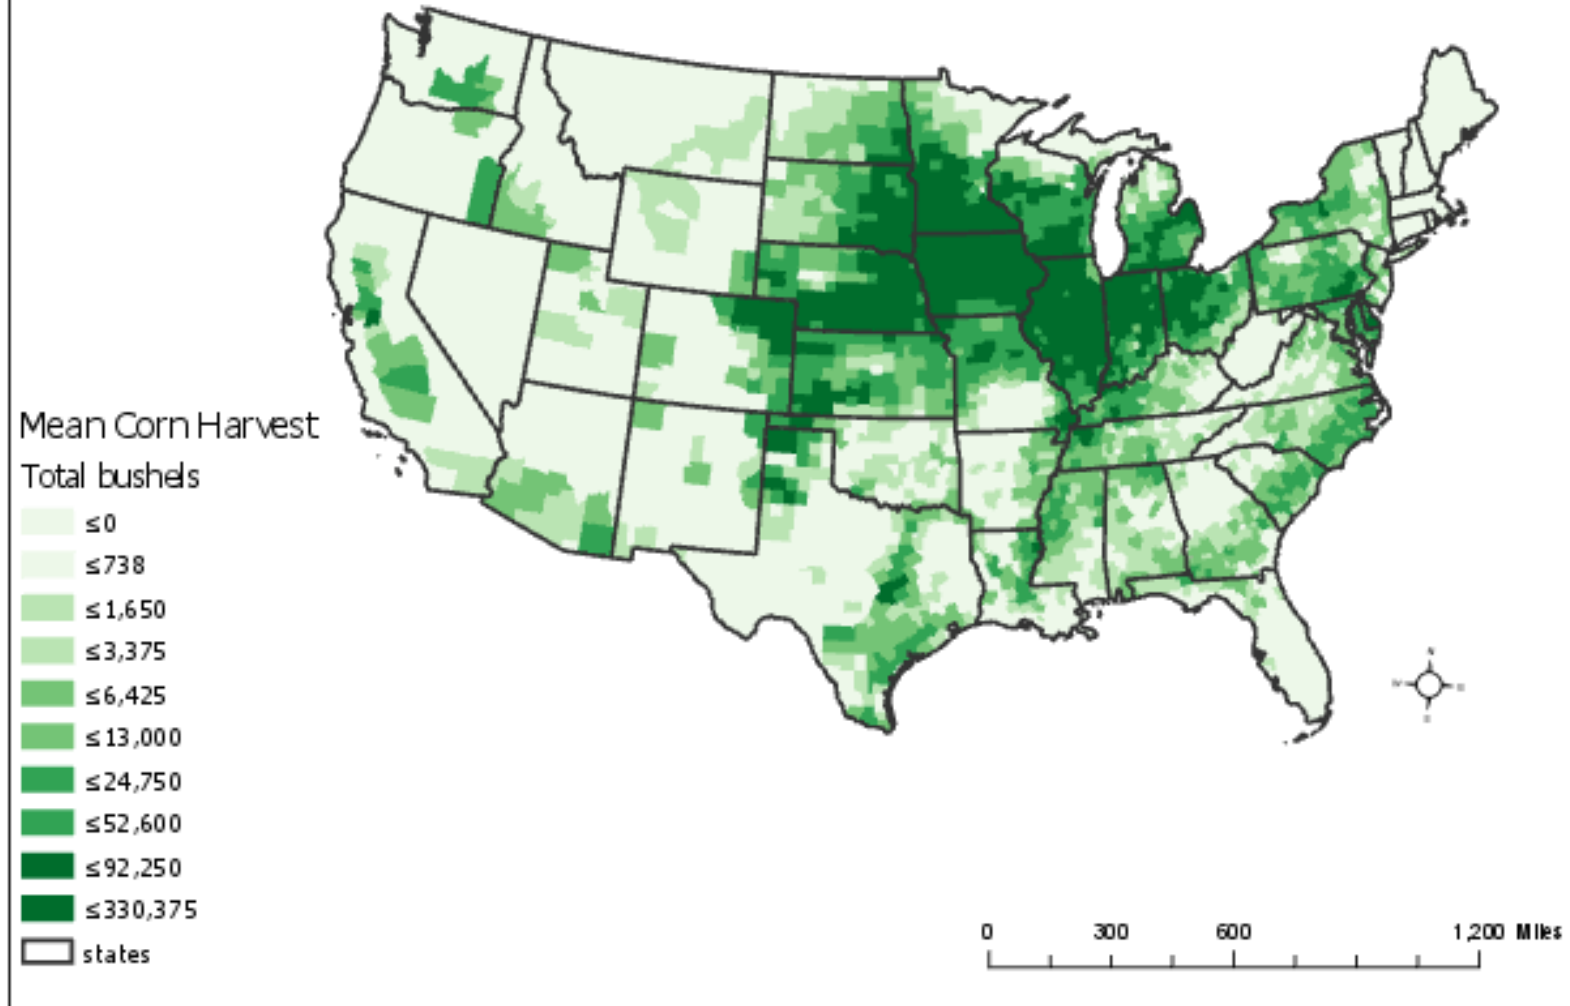

The Corn Map is step by step, introducing a new concept (that of importing an Excel table and summarizing the table before “joining” to a spatial layer. *(Note: when you do join files there will be some Null records as some counties don't grow corn)*

The two California Maps are described but are NOT step by step; this assumes you understand Lab 6 & 7 skills.

*Remember in ArcGIS Pro (and other GIS programs) “understanding” is more about REPEATING tasks until you really learn them. Just getting the “idea” of what is happening is not very useful; GIS skills are very much like learning to ride a bicycle; you have to DO it over and over.*
